

# Welcome!

## 6.1820/MAS.453: Mobile and Sensor Computing aka IoT Systems

<https://6mobile.github.io/>

**Lecturers:** Fadel Adib ([fadel@mit.edu](mailto:fadel@mit.edu))      Tara Boroushaki ([tarab@mit.edu](mailto:tarab@mit.edu))

**TAs:** Waleed Akbar ([wakbar@mit.edu](mailto:wakbar@mit.edu))      Jack Rademacher ([jradema@mit.edu](mailto:jradema@mit.edu))

Course Staff email: [6mobile@mit.edu](mailto:6mobile@mit.edu)

### Announcements

1- Did you introduce yourself on slack?

2- Did you fill in the poll?

Office Hours posted

Friday Tutorial in 66-144 10-11AM

Lab 0 Due next Thursday, Feb 13

Working with IS&T to get Macs

These are tentative slides that we uploaded for students who are interested in taking notes on the slides. The final lecture will be re-uploaded after the class.

# This Week in IoT

## Rocket Lab to launch 5 'Internet of Things' satellites Feb. 8 after delay due to orbital traffic

News

By Mike Wall last updated 2 days ago

The 'IOT 4 You and Me' launch was delayed to ensure there were no space-collision concerns.

When you purchase through links on our site, we may earn an affiliate commission. [Here's how it works.](#)

Kinéis: Constellation of 25 nanosatellites that “can connect any object from anywhere in the world and transmit useful data from these objects to users in near real time.”

How come 25 satellites alone can provide global connectivity?

If so, how would sending more satellites help?

Areas of use?

- natural risk prevention (detection of forest fires, floods, pollution, etc.)
- monitoring of infrastructures and energy networks (detection of anomalies, predictive maintenance, etc.)
- transport and logistics monitoring
- agriculture
- traceability of wild and farmed animals
- monitoring of commercial and leisure maritime activities.

# How to Read a Paper

## First Pass:

- Title, Abstract
- Figures (illustrations? important results?)
- skim intro & conclusions
- References

## Second Pass

- Intro in details
- Overview, related work, or background sections
- Figures in details

## Third pass:

- Read in detail
- Mark references for future read

# Objectives of the Upcoming Three Lectures

Learn the fundamentals, applications, and implications of  
**wireless localization and sensing**

1. What are some motivating applications of localization and location services?
2. What are the unifying principles of wireless positioning?
3. How do systems like GPS, Wi-Fi positioning, Bluetooth ranging, and acoustic ranging work?
4. What is wireless (Wi-Fi) sensing?

# What is Wireless Positioning (aka Localization)?

The process of obtaining a human or object's location using wireless signals

## Applications:

- Navigation: both outdoors (GPS) and indoors (e.g., inside museum)
- Location based services: Tagging, Reminder, Ads
- Virtual Reality and Motion Capture
- Gestures, writing in the air
- Behavioral Analytics (Health, activities, etc.)
- Locating misplaced items (keys)
- Security (e.g., only want to give WiFi access to customers inside a store)
- Delivery drones
- Contact tracing (Bluetooth, etc.)

# What are the different modalities of obtaining location?

- Radio signals: GPS, Cellular, Bluetooth, WiFi
  - Ultrasound signals: similar to those used in NEST
- Inertial sensors
  - Cameras, LIDAR

Focus of this lecture

We will discuss the localization techniques in increasing order of sophistication

# Who performs the localization process?

- Device based: A device uses incoming signal from one or more “anchors” to determine its own location

- Example: GPS

- Network based: Anchors (or Access points) use the signal coming from device to determine its location

- Example: Radar

# 1) Identity-based Localization

Idea: Use the identity and known location of anchor nodes

Example:

- Wardriving -- been used to improve the accuracy of GPS
- WiFi indoor localization

Localize by mapping to one of those locations.

Pros? Cons?

## 2) Received Signal Strength (RSSI)

Idea: Higher power -> closer; lower power-> further

In fact, we can extract more information about exact distance from measured power. Need to understand more about wireless signals

# Wireless Signals are Waves

# Wireless Signals are Waves

**Channel equation (Complex number)**

$$h = \frac{1}{d} e^{j2\pi \frac{d}{\lambda}}$$

# Wireless Signals are Waves

# Wireless Signals are Waves

**Channel equation (Complex number)**

$$h = \frac{1}{d} e^{j2\pi \frac{d}{\lambda}}$$

## 2) Received Signal Strength (RSSI)

From power to distance

Power is proportional to  $1/d^2$

## 2) Received Signal Strength (RSSI)

Trilateration from Distance Measurements

Pros? Cons?

## 2) Received Signal Strength (RSSI)

Solution: Fingerprinting

i.e., measuring device records signal strength fingerprints at each location

Pros? Cons?

### 3) Use the Signal “Phase”

Phase  $\phi = 2\pi \frac{d}{\lambda}$

Pros? Cons?

## 4) Use Angle of Arrival (AoA)

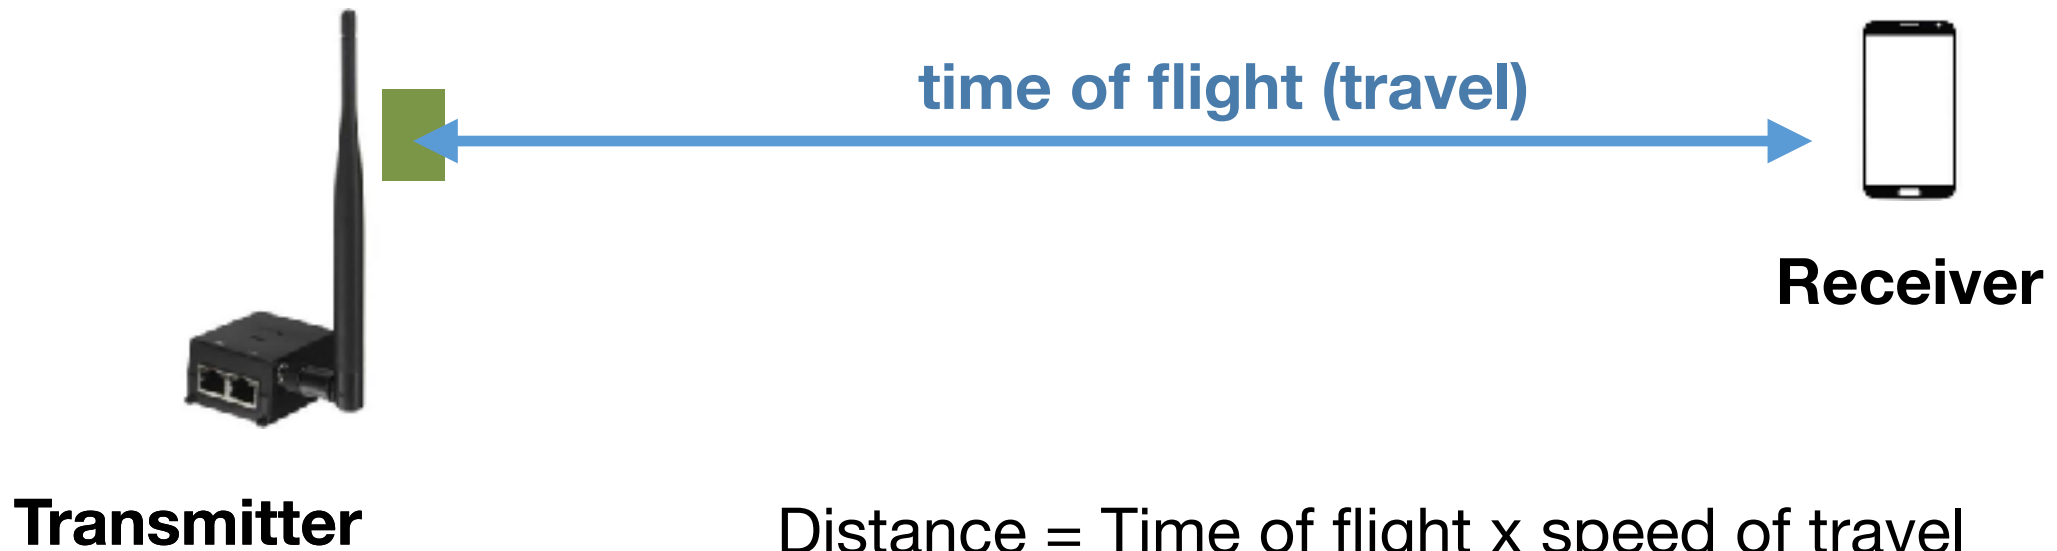

### Triangulation from Angular Measurements

Measure Angle of Arrival (AoA) from device to each AP

## 5) Measure the Time-of-Flight (ToF)

## 5) Measure the Time-of-Flight (ToF)

Can use trilateration (intersection circles/spheres)

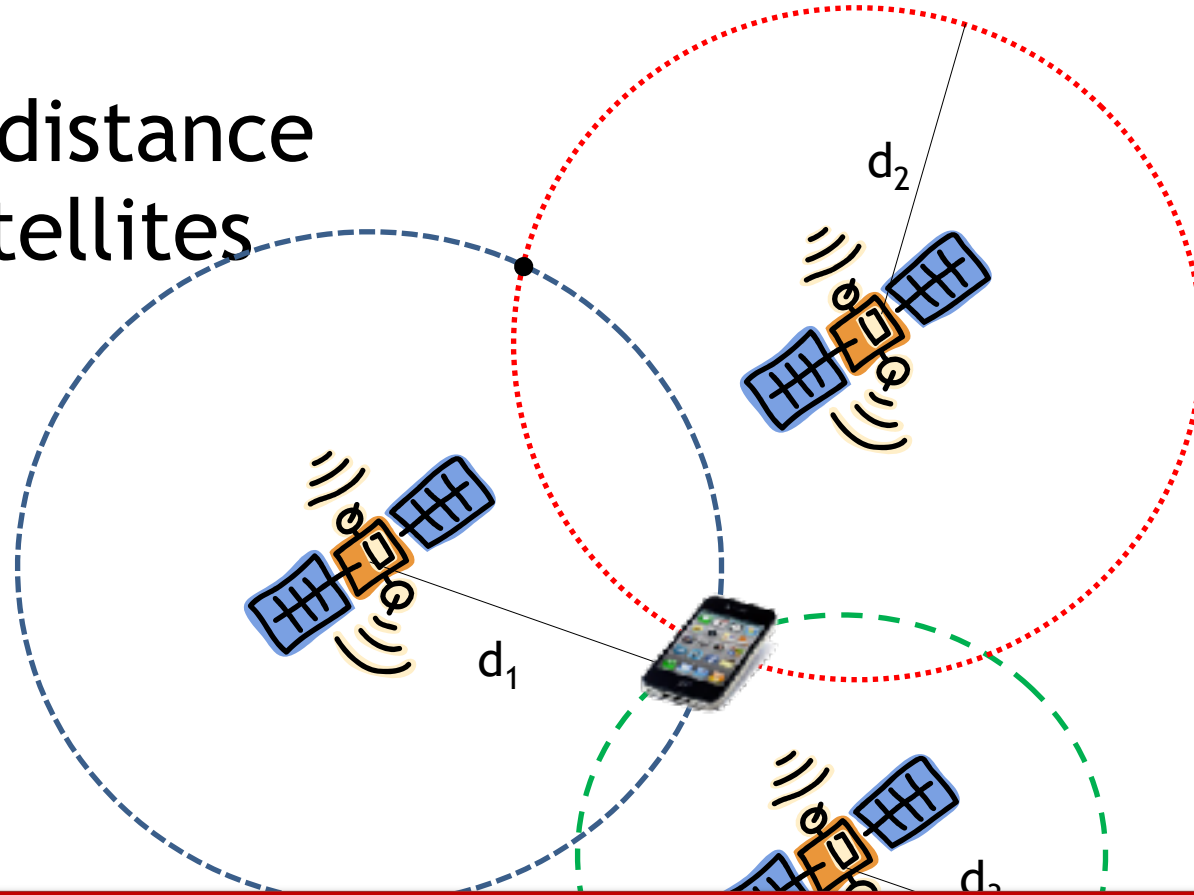

How do we know when the signal was transmitted?

# State-of-the-Art Techniques?

- Sophisticated Combinations of these techniques, e.g.,:
- Combine AoA with time-of-flight
- Use circular antennas and combine with inertial sensing
- Perform synthetic aperture radar and DTW
- Synthesize measurements from multiple frequencies
- ...

# GPS

Compute the distance  
to the GPS satellites

**distance = propagation delay x speed of light**

# How to Compute the Propagation Delay?

Each satellite has its own code

# How to Compute the Propagation Delay?

Code arrives shifted by propagation delay

# How to Compute the Propagation Delay?

Spike determines the delay  
use it to compute distance and localize

# GPS Data Packet

- Almanac & ephemeris data
  - Satellite location, clock, orbital parameters, etc.
  - Bitrate?
    - 50 bits/second
  - Takes about 12.5 minutes to download
- How do today's systems use it?
  - A-GPS (Assisted GPS)
  - WiFi APs are mapped — war-driving

# Objectives of the Upcoming Three Lectures

Learn the fundamentals, applications, and implications of  
**wireless localization and sensing**

1. What are the unifying principles of wireless positioning? 
2. How do systems like **GPS, Wi-Fi positioning, Bluetooth ranging** and acoustic ranging work? **next lecture (case studies)**
3. What is wireless (aka WiFi) sensing?
4. What are the industry opportunities and societal implications of wireless sensing (today and in the near+far future)?

**TODO:**

- 1) Lab 0 Due next Thursday at midnight
- 2) Question for Lecture 3 due on Tuesday at noon
- 3) Office hours to be posted
